## New to our database

This month Mycophenolate (generic Cellcept) has hit the market and we currently carry several strengths and counts. If you have a demand for any that we don't carry please let us know and we can add it for you.

We also began carrying Ovals, upon request of Rx Systems, Inc. When you order Ovals, check with Rx Systems, Inc about their shipping deductible for speedy payment. On top of the Ovals they have some competitive prices on Vials you may want to check out as well.

## Changes abound

This month we're getting underway with a few major changes to BidGenerics.com. Our biggest change will come in the form of an updated website, including some improvements in the way you navigate through the site. We'll keep updates posted as these changes get closer to taking effect.

## Pharmaceutical industry goes green

In the past few years the push for America to go green has hit full force. As it turns out, America listened to what Al Gore had to say (as dramatic as it may have been) and now we're consumed by constant reminders to "Go Green". Recently GreenBiz.com reported that a study done by Climate Counts shows the pharmaceutical industry as the best measurer and reporter of its carbon footprint.

Of the 14 major industry sectors researched by Climate Counts, the pharmaceutical sector shows a great knowledge of how it impacts that environment and takes some leading steps to increase the positive aspect of that impact. Companies like AstraZeneca and Johnson&Johnson were the leading scorers, both meeting the 75 out of 100 mark.

It seems the big picture here is that many associate going green with reducing profits and adding expenditures. But what Climate Counts is trying to get across is that this doesn't have to be the case. Much of the process of improving your carbon footprint involves more upfront costs, but lower costs in the long run. Things like using solar energy as a way to power an office building or warehouse may prove to be an expensive investment but in the long run the electric bill is nearly eliminated every month and creating that energy doesn't release any carbon into the atmosphere.

In the end it's up to us to take steps now to help out future generations. Global warming may be a natural cycle but we can all do our part to slow the process.
